**Project proposal**: I plan on creating a donation tracking system for a non-profit charity organization that helps endangered red pandas. It will allow users to set up a profile when they donate and organize new donations by automatically assigning them to a leaderboard showing the top 10 donations of all time. It will also automatically determine what rewards the donator is eligible for and keep track of their total lifetime donations. These rewards will very from a picture of one of the red pandas to physical rewards such as tee shirts and plushies that will require the person's email and address. This will all be visible in a section visible to the organization that shows who needs what rewards and where to send them. Overall, it shouldn't require too many pages to function and can work on a very simple UI. The classes I currently plan on using are "users", "Rewards", and "Orders".

**In retrospect:** This proposal was too ambitious for my skills as I ended up using Django for my final project. Django was very difficult to learn, but I did get the hang of the basics. However, my earlier proposal was heavily based on creating users and tying variables to them. While I tried to implement this, I found that creating new users without using the admin panel required knowledge that I did not have, and using the official Django documentation was confusing. Instead, I simplified the hierarchy to only focus on the donation page.

**Class chart:**

Instead of the previous “users”, ”Rewards”, and “Orders” classes I proposed, I used “donation”, “donation list”, and “donation details”. All of which used the “donation” model in different ways.

**Final Report and Sample:**

I tested the “add donation” feature and due to Django’s input validation, it won’t have issues adding new donations. Some sample inputs I tried were:

Amount: 100
Message: I love you!

Resulted in:

**100.00**

Donated by sharker5000 on Oct. 15, 2026, 12:58 p.m.

I love you!

Amount: 1.00
Message: Have some spare change for our little buddies

Resulted in:

**1.00**
